

NASA/JPL's UAVSAR

Uninhabited Aerial Vehicle Synthetic Aperture Radar (SAR)

Polarimetric SAR image (channels: **HH** **HV** **VV**) of El Salvador's San Miguel Volcano (March 8, 2013)
San Miguel last erupted on December 29, 2013, prompting the evacuation of thousands of people living in a 3 km radius of the volcano.

The Uninhabited Aerial Vehicle Synthetic Aperture Radar (UAVSAR) provides measurements used to study vegetation, soil moisture, ice, and changes in the Earth's surface.

Originally developed to fly in a single pod underneath NASA's Gulfstream-III jet, the system has been modified to fly on the long-range high endurance Global Hawk UAV. UAVSAR's modular design is reconfigurable between multiple radar bands (L, P, Ka) and is used both as a flying test-bed for the development of future space missions and to gather valuable airborne data for ongoing Earth science research.
